

SWISSmixIT

Extract • Mix • Formulate DIY Home System

The system allows home DIY extraction of botanicals for topical oil. A carrier oil (Olive oil or other vegetable oils) actually draws out the oil from any botanical that has oil with time and mixing. A hi-tech solid state mixer agitates the solution to reduce the time needed for extraction.

Using a standard Mason jar allows you to have the option of making different botanical extractions, while providing a simple and effective way to dispense the oil right from the solution. A food-grade reusable filter ensures the botanical material is left in the jar, while pure oil is dispensed. This system is for production of topical oils which can be applied to skin, which include Hemp flower, Gooseberry, Oregano, and other antioxidants. Mix and match to experiment with different herbal remedies. The Pod system with solid state mixing can also be used for other future additions, including air filtration, making skin creams, and other functions.
